

Version History

- 1.0 Original version.
- 1.01 Changed: the URL that gets called (the previous URL was too long for SASP!)
Changed: "newPassword" is renamed to "newLoginPassword".

Important: this call must not be made immediately after a Tier 2 Partner Password Reset Request call. Please read the Tier 2 Partner Password Reset Request specification for details on the email-based authentication that needs to occur.

1. Request

The request should be POSTed (rather than GETed) to the above URL.

Required variables are in **bold**.
Optional variables are in *italics*.

Variable Name (case insensitive)	Type	Max. Length	Description
orderNumber	string	128 chars	The Order Number of an order that has been placed on SASP (this should be the same Order Number that was specified in a previous Password Reset Request call)
confirmPassword	string	64 chars	The Confirm Password that was returned in a previous Password Reset Request call

2. Response

The MIME type will be `application/x-www-form-urlencoded`, because the format of the response will be the same "URL-encoded" format as the request (e.g. `name1=value1&name2=value2`).

Here are the names of the various variables that will or may appear in the response:

Variable Name (case insensitive)	Type	Description
errorCode	integer	Error code (see list below for possible values)
<i>errorMessage</i>	string	Explanation of error
newLoginPassword	string	New Admin User Login Password

Here are the possible values for "errorCode" and "errorMessage":

errorCode	errorMessage
0	Successful
-1	Request was not made over HTTPS!
-2	'xxx' is an unrecognized argument!
-3	The 'xxx' argument is missing!
-4	The value of the 'xxx' argument is invalid!
-14	An unknown error occurred!
-16	Permission denied!
-17	Request used GET rather than POST!
